                                                                                                                                                                                                                                                                                                                                                                                                                                                              Virology 193:868-876(1993).

-I-FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

-I-CATALYTIC ACTIVITY: Hydrolysis of alpha-(2-3)-, alpha-(2-%)-, alpha-(2-%)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                       MEDIINE-93212520; PubMed-8460490;

"Phylogenetic analysis of the N8 neuraminidase gene of influenza A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SÜBÜNIT: Homotetramer.
-!- SÜBÜLÜLAR LOCATION: Viral membrane. Forms a mushroom-shaped
spike on the surface of the virion.
-!- SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (POTENTIAL). (POTENTIAL). (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (POTENTIAL)

                                                                                                                                                                                                                                                                                                                       -I. FUNCTION: Removes the terminal stalic acid from carbohydrate side -I. FUNCTION: Removes the terminal stalic and from the viral chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-I. CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -:- SÜBÜNIT: Homotetramer.
-:- SUBGELULAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
-:- SIMILARITY: Belongs to family 34 of glycosyl hydrolases.

Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection. - CAPALYTIC ACTIVITY: Hydrolysis of alpha (2->3)-, alpha (2->6)-, alpha (2->8)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBUNIT: Homotetramer.
SUBCELLULAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BY SIMILARITY.

                                                                          Virology 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycopsidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Albert S., Bhattacharya D., Klaudiny J., Schmitzova J., Simuth J.;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eŭkaryota, Metazoa, Arthropoda, Hexapoda, Insecta, Pterygota,

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2-3)., alpha-(2-56)-, alpha-(2-8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                           Eur. J. Blochem. 267583-595(2000).

C. 1- FUNCTION: Potent activity against S.litura larvae.

-1- FUNCTION: Binds to sodium channels and inhibits the inactivation of the activated channels. This toxin is active only on insects.

C. 1- SUBCELLULAR LOCATION: Secreted.

-1- TISSUE SPECIFICITY: Expressed by the venom gland.

-1- MASS SPECIROMETRY: WM=4031.9; WEFHOD-FMALDI.

C. 1- SIMILARITY: Belongs to the mu-agatoxin family.

Bur. J. Biochem. 230:235-241(1995).

-!- FUNCTION: This protein is one of the nuclear-coded polypeptide chains of cytochrome c vidase, the terminal oxidase in mitochondrial electron transport.

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + 0(2) = 4 ferricytochrome
                                                                                                                                                                                                               SEQUENCE FROM N.A.

This sec-independent pathway is termed TAT for twin-arginine translocation system. This system mainly transports proteins with bound cofactors that require folding prior to export (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                 DNA Res. 7:331-338 (2000).

-I- FUNCTION: Catalyzes the S-adenosylmethionine monomethyl esterification of trans-aconitate (By similarity).

-I- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + trans-aconitate = S-adenosyl-L-methionine + trans-aconitate = S-adenosyl-L-homocysteine + (B)-3-(methoxycarbonyl)pent-2-enedioate.

-I- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-I- SIMILARITY: Belongs to the methyltransferase superfamily. Tam

Defects in DET2 leads to defects in light-regulated development. PATHWAX: Brassinolide biosynthesis. SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                 Arabidopsis thaliana (Mouse-ear cress).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Majewski C., Trebst A.,
"The pet genes of Rhodospirillum rubrum: cloning and sequencing of
the genes for the cytochrome bcl-complex.";
Mol. Gen. Genet. 224:373-382(1990).
-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-cl complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBÜNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bacteria, Proteobacteria, Alphaproteobacteria, Rhodospirillales,

Nature 406:959-964(2000).

-!- FUNCTION: METHYLATION OF THE MEMBRANE-BOUND METHYL-ACCEPTING CHEMOTAXIS PROTEINS (MCP) TO FORM GAMMA-GLUTAMYL METHYL BSTER RESIDUES IN MCP (BY SIMILARITY: L-methionine + protein L-glutamate = S-adenosyl-L-homocysteine + protein L-glutamate methyl ester.

-!- SIMILARITY: Contains 1 cheR-type methyltransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-MAR-1987 (Rel. 04, Created)

-!- INDUCTION: WHEN E.COLI CELLS ARE EXPOSED TO DOSES OF DNA
ALKYLATING AGENT. IT IS NOT INHIBITED BY REACTION PRODUCTS.
-!- SIMILARITY: Belongs to the alkylbase DNA glycosidase alkA family.

THIS SIGNA FACTOR IS RESPONSIBLE FOR THE EXPRESSION OF HEAT SHOOKY TROWNOTERS (BY SIMILARITY).
SIMILARITY: Belongs to the sigma-70 factor family. Sigma-32
                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                          Arch. Biochem. Biophys. 270:114-125(1989).
--- FUNCTION: May play a role in nitrite reduction. Shows peroxidase activity on proteolytic modification.
--- SUBCELLUIAR LOCATION: Periplasmic.
--- INDUCTION: By anaerobic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Submitted (MAY-1993) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the S2P family of ribosomal proteins.
-!- CAUTION: Was originally thought to be a laminin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 1; Length 295;

Grosso L.E., Park P.W., Mecham R.P.;
Grosso L.E., Park P.W., Mecham R.P.;
Characterization of a putative clone for the 67-kilodalton
elastin/laminin receptor suggests that it encodes a cytoplasmic
protein rather than a cell surface receptor.";
Blochemistry 30.3346-3350(1991).
-! SUBCELLULAR LOCATION: Cytoplasmic.
-! SUBCELLULAR LOCATION: Cytoplasmic.
-! SIMILARITY: Belongs to the S2P family of ribosomal proteins.
-! CAUTION: Was originally thought to be a laminin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-FEB-1995 (Rel. 31, Created)

"A map of 75 human ribosomal protein genes.";
Genome Res. 8:509-523(1998).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUMILARITY: Belongs to the S2P family of ribosomal proteins.
-!- CAUTION: Was originally thought to be a laminin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 66.7%; Score 4; DB 1; Length 295; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
-i- PTM: The N-terminus is blocked.
-i- SIMILARITY: Belongs to the S2P family of ribosomal proteins.
-i- CAUTION: Was originally thought to be a laminin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

"The crtE gene in Erwinia herbicola encodes geranylgeranyl
diphosphate synthase.";
Proc. Natl. Acad. Sci. U.S.A. 89:6761-6764(1992).
-!- CATALYTIC ACTIVITY: Trans-trans-farnesyl diphosphate + isopentenyl
diphosphate = diphosphate + geranylgeranyl diphosphate.
-!- PATHWAY: Carotenoid biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape

J. Mol. Neurosci. 18:3610-3618(1998).
J. Mol. Neurosci. 18:3610-3618(1998).
I. FUNCTION: May be signaling molecules that resemble neuropeptides and that act by binding to alpha-neurexins and possibly other receptors (Potential).
I. SUBCELLULAR LOCATION: Secreted (Potential).
I. SUBCELLULAR LOCATION: Secreted in brain, spleen, and testis.
I. FISSUE SPECIFICITY: Expressed in brain, spleen, and testis.
I. FIM: May be proteolytically processed at the boundary between the N-terminal nonconserved and the central conserved domain in neuron-like cells (SP similarity).
I. SIMILARITY: Belongs to the neurexophilin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Agap junction protein, cardiac - rat (fragment)
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Date: 25-Oct-1987 #sequence_revision 25-Oct-1987 #text_change 16-Jul-1999
C;Accession: A24047
J Biol. Chem. 260, 6514-6517, 1985
A;Nithe: The Mr 28,000 gap junction proteins from rat heart and liver are different but 1A;Reference number: A95530; MUID:85207650; PMID:2987225
A;Accession: A24047
A;Redicule: type: protein
A;Residues: 1-32 <NIC>
C;Superfamily: gap junction protein
C;Superfamily: gap junction protein
C;Keywords: cardiac muscle; heart; transmembrane protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    R;Corzo, G.

Lype IV prepilin peptidase (EC 3.4.99.-) - Neisseria sicca (strain LNP3265) (fragment)
NyContains: type IV pilin N-methyltransferase (EC 2.1.1.-)
Syscies: Neisseria sicca
C;Species: Neisseria sicca
C;Date: 23-Mar-1995 #sequence_revision 23-Mar-1995 #text_change 29-Jan-1999
C;Accession: D53374
